Introduction to Raspberry Pi

*Ville Klar
Doctoral Candidate
Machine Design*

What is Raspberry Pi ?

- Arguably the most popular single board computer (SBC)
 - Easy to get started with because basically every problem is documented
- Add a computer with a OS to practically anything
 - NOTE: Do not expect it to perform as well as your laptop
- Support for a vast array of peripherals (thanks to the Linux kernel)
 - USB devices, networking, displays, cameras, audio etc.

What can you do with a Pi? (not so cool)

Raspberry Pi models

Raspberry Pi advantages and disadvantages

- Cheap (price per performance)
- Well documented
- Availability
 - Also in terms of add-ons (HATs)
- Versatile
- Compact (especially Zero)

- Scary linux (learning required)
- Not real time*
- No ADC (easy to add though)
- PWM possible but limited frequency

* It is possible to install a RTOS on the Pi

Getting started

- 1. Install OS**
- 2. Configure OS**
- 3. Connect peripherals**
- 4. Write software**
- 5. Profit (?)**

OS options

NOOBS

RASPBIAN

WINDOWS 10 IOT CORE

RISC OS

A non-Linux distribution

with Pixel or Lite

OSMC

LIBREELEC

UBUNTU MATE

SNAPPY UBUNTU CORE

Installation process

- Get SD card (micro on newer Pi's)
- Format to FAT32 (for example with SD card formatter)

Using NOOBS:

- Download NOOBS (sd-cards with pre-installed NOOBS can purchased)
- Unzip and copy all contents to SD card (takes a while)
- Boot

Using a disk image writer:

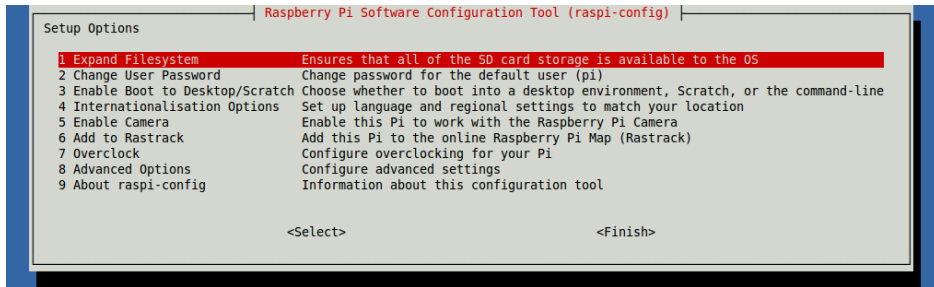

- Download the disk image (.img)
- Write the disk image on the SD card ("hard drive")
 - Windows: Win32 disk image writer or Etcher
 - MacOSX / Linux: Use dd (or image writer with GUI such as Etcher)
- Boot

Connections

On first boot...

- NOOBS installer has GUI (Raspbian recommended)
- Boots into raspi-config (you can run it with “sudo raspi-config”)
- Expand file system, change password and change keyboard layout, enable ssh etc.

Terminal or Pixel

- There are two options when booting: shell or Pixel desktop (graphical session)

```
Debian GNU/Linux wheezy/sid raspberrypi tty1
raspberrypi login: pi
Password:
Last login: Tue Aug 21 21:24:50 EDT 2012 on tty1
Linux raspberrypi 3.1.9+ #168 PREEMPT Sat Jul 14 18:56:31 BST 2012 armv6l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.

Type 'startx' to launch a graphical session

pi@raspberrypi ~ $
```

Connect to WLAN

In GUI:

- Choose WiFi network and connect

Without GUI :

- `sudo iwlist wlan0 scan`
- `sudo nano /etc/wpa_supplicant/wpa_supplicant.conf`
- Add this to the bottom of the file

`// scan for networks`

`// open wpa_supplicant configuration`

```
network={  
    ssid="aalto open"  
    proto=RSN  
    key_mgmt=NONE  
}
```

SSH

- Secure shell = Easy way to remotely access a Pi
- After connecting to a WLAN we need to find out the Pi's ip address
 - Type 'ip a' in a terminal output is something like this
- If you don't have a monitor connected you can try to nmap the ip
- If the Pi connects to the same router between boots, DHCP should give it the same ip
 - You can also configure a static IP

```
pi@raspberrypi:~ $ ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group default qlen 1
    link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
    inet 127.0.0.1/8 scope host lo
        valid_lft forever preferred_lft forever
    inet6 ::1/128 scope host
        valid_lft forever preferred_lft forever
2: wlan0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP group default qlen 1000
    link/ether 00:19:86:82:0c:d3 brd ff:ff:ff:ff:ff:ff
    inet 10.100.7.21/8 brd 10.100.63.255 scope global wlan0
        valid_lft forever preferred_lft forever
    inet6 fe80::8fb3:aeb3:6795:5478/64 scope link
        valid_lft forever preferred_lft forever
pi@raspberrypi:~ $
```

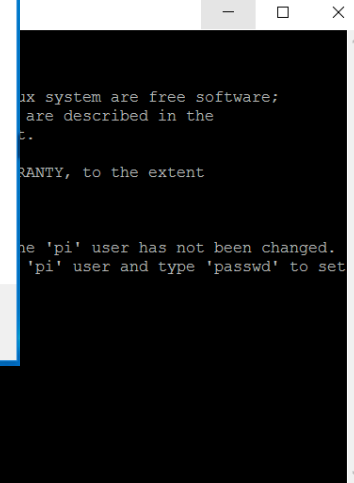

Local ip address

SSH

When you have obtained the ip-address you can access the Pi with e.g. Putty

If you can't be bothered with IP addresses
You can also use hostnames
(also open)

CLI / Shell commands

Command	Description
ls	List contents of current directory (folder)
cd	Change directory
mkdir	Creates a new directory (make directory)
sudo	Execute as super user ("admin" / root privileges)
cp	Copy (syntax is cp src dest)
mv	Move (syntax is mv src dest)
rm	Remove
./	Dot-slash means execute
nano	Launch nano text editor
apt-get update	Update repository list (update list of links to software downloads)
apt-get install	Install a package
reboot	Reboots the system (run with sudo)
poweroff	Turns the Raspberry Pi off (run with sudo)

CLI/ Shell tips

- Use tab to make the terminal autocomplete
 - Up and down keys to browse command history
 - Ctrl+c to kill a process, Ctrl+z to stop a process
 - Ctrl+r to search command history
 - Use 'exit' to close a terminal window
 - Type 'man' before the command to see it's manual
 - Github repositories can be cloned (copied) with 'git clone'
-
- You can also open an sftp connection to the Pi to view and edit files & folders

Programming language options

- Almost everything
 - C, C++, Python2/3, Javascript (node), Ruby, Lisp, Rust...
- Most projects are either C or Python

GPIO Libraries

- **WiringPi (C and Python)**
 - Blink example : <http://wiringpi.com/examples/blink/>
- **RPIO (python2/3)**
 - PWM via DMA (up to 1 μ s resolution)
- **Bcm2835.h (C)**
- **Pigpio (javascript / python/ C)**

Demo 1: Video streaming

- Installation instructions: <https://github.com/jacksonliam/mjpg-streamer>
 - Already installed in these Pi's
- Connect the Raspicam, make sure it is working with
`raspistill -o cam.jpg`
- Run mjpeg-streamer with (first cd into ~/Software/mjpg-streamer/mjpg-streamer-experimental) :
`export LD_LIBRARY_PATH=.`
`./mjpg_streamer -o "output_http.so -w ./www" -i "input_raspicam.so"`
- View the stream at <http://localhost:8080> or with another computer (on the same network) at <http://<IP-address-of-Pi>:8080>
- You can also use usb web cameras with mjpeg-streamer
- There are many other options for streaming: clvc, gstreamer,
- Use ctrl+c to kill the stream

Demo 2: WiringPi

- Open terminal
- `cd into ~/Software/WiringPi_Blink`
- Connect LED to gpio 29 and short lead to ground
 - We should put a current limiting LED but we can break the rules
- Run blink with `sudo ./blink`
- Try changing the pin to 28 (in the code) and run make to compile

Raspberry Pi GPIO Header

BCM	WiringPi	Name	Physical	Name	WiringPi	BCM	
		3.3v	1	2	5v		
2	8	SDA.1	3	4	5V		
3	9	SCL.1	5	6	0v		
4	7	1-Wire	7	8	TxD	15	14
		0v	9	10	RxD	16	15
17	0	GPIO. 0	11	12	GPIO. 1	1	18
27	2	GPIO. 2	13	14	0v		
22	3	GPIO. 3	15	16	GPIO. 4	4	23
		3.3v	17	18	GPIO. 5	5	24
10	12	MOSI	19	20	0v		
9	13	MISO	21	22	GPIO. 6	6	25
11	14	SCLK	23	24	CE0	10	8
		0v	25	26	CE1	11	7
0	30	SDA.0	27	28	SCL.0	31	1
5	21	GPIO.21	29	30	0v		
6	22	GPIO.22	31	32	GPIO.26	26	12
13	23	GPIO.23	33	34	0v		
19	24	GPIO.24	35	36	GPIO.27	27	16
26	25	GPIO.25	37	38	GPIO.28	28	20
		0v	39	40	GPIO.29	29	21
BCM	WiringPi	Name	Physical	Name	WiringPi	BCM	

Demo 3: Servo

- Open terminal
- `cd` into `~/Software/Python_Servo`
- Connect servo to gnd, 5V and GPIO 4
- Run `sudo pigpiod` to start the gpio daemon
- Run the python script with
`python servo_demo.py`
- You can give another pin as an argument to the script e.g. `python servo_demo.py 18`
- Try changing the speed of the servo

Raspberry Pi GPIO Header

BCM	WiringPi	Name	Physical	Name	WiringPi	BCM
		3.3v	1	2	5v	
2	8	SDA.1	3	4	5V	
3	9	SCL.1	5	6	0v	
4	7	1-Wire	7	8	TxD	15
		0v	9	10	RxD	16
17	0	GPIO. 0	11	12	GPIO. 1	1
27	2	GPIO. 2	13	14	0v	18
22	3	GPIO. 3	15	16	GPIO. 4	4
		3.3v	17	18	GPIO. 5	5
10	12	MOSI	19	20	0v	24
9	13	MISO	21	22	GPIO. 6	6
11	14	SCLK	23	24	CE0	10
		0v	25	26	CE1	11
0	30	SDA.0	27	28	SCL.0	31
5	21	GPIO.21	29	30	0v	1
6	22	GPIO.22	31	32	GPIO.26	26
13	23	GPIO.23	33	34	0v	12
19	24	GPIO.24	35	36	GPIO.27	27
26	25	GPIO.25	37	38	GPIO.28	28
		0v	39	40	GPIO.29	29
BCM	WiringPi	Name	Physical	Name	WiringPi	BCM

Tips

- For (prototype) web servers: Python Flask
- For GUIs: Tkinter (Python) or Qt (C++) or Node.js+Express.js
- If you need e.g. read analog voltages and control motors → consider combining an Arduino with a Raspberry Pi
(Raspberry Pi commands Arduino board via serial (USB))
